reflect accurately this particular CDNA clone. However, there are artifacts associated with the generation of CDNA clones that may have not been detected in our initial analyses such as internal priming, priming from contaminating genomic DNA, retained introns due to reverse transcription of unsplaced precursor RNAs, and reverse transcriptase errors that result in single base changes. For further information about this sequence, including its location and relationship to other sequences, please visit our Web site changefruitfly.berkeley.edu) or send email to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PGIFKSTCKMDITWFPFDDQHCBMKFGSWTYDGNQLDLVLSSEDGGDLSDFITNGEWY

New nucleic acid encoding a nicotinic acetylcholine receptor from insects, used to identify potential insecticides.

Claim la; Page 14-17; 26pp; German.

This invention describes a novel nucleic acid (NA) encoding a nicotinic acetyl-choline receptor (I) from insects which can be used as an insecticide. Inhibitors of (I) interfere with neurotransmission. (I) (also vectors containing it, its regulatory regions, and antibodies directed against (I)-encoded proteins) are used to screen for: (a) plant protection agents that alter conductance of AChR, potentially useful as

insecticides, or (b) genes which encode polypeptides that are involved i formation of functionally related AChR in insects. (I) are also used to isolate and characterize the specified regulatory regions and for recombinant production of (II). This sequence encodes an acetyl-choline receptor isolated from Heliothus virescens
                                                                                                                                       ATGGCGGGCGCGCCGCTCGCACTTGGCGGCGCCCGCGGGGCCTGCTGCTGCTGCTG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             877 ACGATGCCAGCGACGTCGGACGCCGTGCCCTTGCTCGGCACCTACTTCAACTGCATCATG 936
                            This invention describes a novel nucleic acid (NA) encoding a nicotinic acetyl-choline receptor (I) from insects which can be used as an insecticide. Inhibitors of (I) interfere with neurotransmission. (I) (also vectors containing it, its regulatory regions, and antibodies directed against (I)-encoded proteins) are used to screen for: (a) plant protection agents that alter conductance of AChR, potentially useful as insecticides, or (b) genes which encode polypeptides that are involved in formation of functionally related AChR in insects. (I) are also used to isolate and characterize the specified regulatory regions and for recombinant production of (II). This sequence encodes an acetyl-choline
                                                                                                                                                                                                                                                                                                                                                                                                                    GCCAACGAGGGAACGCTAGGGTCGGCTTGGCTTGACTTGCAGCAAATCATTGAC
